

Potting Checklist

A pretty pot with no hole is a cachepot: keep the plant in a nursery pot inside it. This list is the boring stuff that keeps roots alive.

Before you start

- ☐ New pot is only 2-5 cm wider than the current one (giant pots stay wet and rot roots).
- ☐ The growing pot has a real drainage hole.
- ☐ If the outer pot has no hole, use it as a cachepot and pour off leftover water.
- ☐ Fresh mix ready. No gravel layer in the bottom. It does not add drainage.

While you pot

- ☐ Ease the plant out without tearing roots.
- ☐ Tease circling roots so they can grow outward.
- ☐ Set it at the same depth it was before.
- ☐ Fill and gently firm (just enough to drop air pockets). Do not compact like cement.

Aftercare

- ☐ Water until it runs out the hole.
- ☐ Empty the saucer after 15-20 minutes.
- ☐ Skip a huge feed right away. Let it settle for a week unless the care card says otherwise.
- ☐ Note the plant name and date on this sheet or a plant tag.
